Unlike standard slots where symbols need to line up on a grid, Limbo features a single number: **the target multiplier**.

How a Standard Round Works:

1. **Place a Bet:** The gamer chooses just how much cryptocurrency or fiat to bet on the upcoming round.
2. **Set a Target Multiplier:** The player inputs their preferred winning multiplier (e.g., 2.0 x, 10x, or even 1000x).
3. **Roll the Dice:** The game engine produces a random multiplier result.
4. **Figure out the Outcome:** If the created result is **equivalent to or greater** than the player's target multiplier, the bet wins. If it falls below the target, the bet loses.

Why Has Limbo Become So Popular?

Limbo's rise in popularity isn't a mishap. Several distinct features set it apart from legacy gambling establishment video games:

- **Extreme Customization:** Players aren't stuck to pre-programmed chances. They can pick to play securely with a 1.01 x multiplier or chase life-altering payments with a 1,000,000 x multiplier.
- **Lightning-Fast Gameplay:** Rounds take less than a 2nd. There are no lengthy animations or perk rounds to sit through.
- **Provably Fair Algorithm:** Most contemporary Limbo video games utilize cryptographic hashing, permitting gamers to independently confirm that the gambling establishment did not rig the outcome.
- **Low House Edge:** Crypto gambling establishments usually use a home edge of simply 1% on Limbo, making it one of the mathematically fairer video games on the floor.

The Mathematics Behind Limbo

To play Limbo successfully, players need to understand the relationship between the target multiplier and the win probability. In gambling establishment terms, likelihood is inversely proportional to the payout.

The formula for the win chance in a standard Limbo game is normally calculated as:

£ £ \ text Win Chance (%) = \ frac 100 \ text Target Multiplier \ times (1 - \ text Home Edge)£ £

(Note: Exact percentages vary a little depending upon the particular gambling establishment's home edge, typically set at 1%).

Limbo Multiplier vs. Win Probability Reference Table

Target Multiplier Approximate Win Probability Payout on a £ 10 Bet **1.05 x** 94.05% £ 10.50 **2.00 x** 49.50% £ 20.00 **5.00 x** 19.80% £ 50.00 **10.00 x** 9.90% £ 100.00 **50.00 x** 1.98% £ 500.00 **100.00 x** 0.99% £ 1,000.00 **1,000.00 x** 0.099% £ 10,000.00 **10,000.00 x** 0.0099% £ 100,000.00

As seen in the table above, the greater the multiplier you target, the lower your statistical chance of winning that round.
