Optical Character Recognition (OCR)

The foundation of any live table video game is OCR innovation. Tiny sensors embedded in the table and the dealership's shoe read the physical cards as they are drawn and swiped. This information is instantly converted into digital information, upgrading the player's on-screen interface in real-time so they can position bets, see their hand overalls, and make strategic decisions without lag.

Video Game Control Unit (GCU)

Every live table is geared up with a GCU-- a device approximately the size of a shoebox encoded to the table. The GCU handles the video game's video encoding, guaranteeing that the high-definition stream is transferred to gamers globally without latency or buffering problems.

Why Players Prefer the Immersive Route
